Obesity is a multifaceted problem, affecting many different organs and systems. It is one of the most difficult public health challenges facing the United States today. Approximately 86 million Americans are obese (i.e., have a body mass index, BMI≥30); approximately 16 million Americans have a BMI≥40. Obesity has become increasingly common in society as a whole over the past few decades. Bariatric surgery has been performed in selected patients with morbid obesity, in order to produce sustained, substantial weight loss and to correct comorbid conditions. A number of surgical procedures are used to treat morbid obesity. The most common are Roux-en-Y gastric bypass, biliopancreatic diversion, adjustable gastric banding, and silastic ring annuloplasty. Other procedures are stapled pyloroplasty, gastroplasty (e.g., Sanchez procedure), biliointer anastomosis, gastroenteric anastomosis, argyle reversal, gastroplasty with posterior fundoplication, gastroenteric bypass, gastroplasty with inter
